

Why do AVIs exported from BlueView not work in Windows Media Player?

BlueView allows you to export files to AVI using different video compression algorithms. Some of these algorithms are not supported by Windows Media Player because they require a codec that is not part of the standard installation. These files may play in other players, such as VideoLan's VLC (www.videolan.org).

In order to export a file that will work in Windows Media Player, select the "Microsoft Video 1" video compression algorithm, which is an option when exporting the data.
