## How is the C3 data displayed or recorded during the operation?

C3 data is stored internally and can be streamed real time to a terminal window and recorded to a file using VideoRay's topside computer. The C3 data is time-stamped and includes the depth and temperature. Using the time-stamp, the C3 data can be cross-referenced to the VideoRay video if the VideoRays text overlay is enabled and the video is recorded. The data can also be geo-referenced with positioning system data from optional position tracking systems.
